

**230 Volt Two-Stage Totally Enclosed Vacuum Motors**

**For Commercial and Industrial Vacuum Equipment Used in Hazardous Locations**

**DESCRIPTION**

This single-phase, two-pole universal motor series is totally enclosed, externally fan-cooled, and is combined with a centrifugal blower to produce vacuum airflow characteristics suited for vacuum blower applications. The motors are available in both 120-and 230-volt AC models and incorporate class B insulation in the armature and field windings.

The vacuum air is drawn into the bottom of the fan case and is discharged through openings between the upper and lower mounting flanges. Motor cooling air is drawn in the top of the die cast aluminum shell and is directed over the outside of the enclosed motor. An internal fan circulates air through the electrical parts to properly transfer heat to the outside housing of the motor.

**APPLICATION**

These motors have been listed by Underwriters Laboratories Inc. Guide PTDR, File E-25653 for use in hazardous locations with respect to safety of operation as follows:

**Class I, Group D**--Atmospheres containing gasoline, petroleum, naphtha, benzene, butane, propane, alcohols, acetone, benzol, lacquer solvent vapors, or natural gas.

**Class II, Group E**--Atmospheres containing metal dust, including magnesium, aluminum, and their commercial alloys.

**Class II, Group F**--Atmospheres containing carbon black, coal, or coke dust.

**Class II, Group G**--Atmospheres containing flour, starch, or grain dusts.

These motors are designed for use in commercial and industrial vacuum equipment which employ filters to remove dirt from the air stream before reaching the vacuum fans. While these vacuum motors are listed for use in hazardous locations, that in itself does not mean that the end product has hazardous duty characteristics. The design of the equipment must be evaluated by Underwriters Laboratories Inc. or other listing or regulatory agency to determine if the end product is suitable for use in hazardous locations.

**TYPICAL MOTOR PERFORMANCE.\***

(At 230 volts, 60Hz, test data is corrected to standard conditions of 29.92 Hg, 68° F.)

**WARNING** - When using AMETEK Lamb Electric bypass motors in machines that come in contact with foam, liquid (including water), or other foreign substances, the machine must be designed and constructed to prevent those substances from reaching the fan system, motor housing, and electrical components. Lamb Electric vacuum motors other than hazardous duty models should not be applied in machines that come in contact with these substances.
